

Module 10:

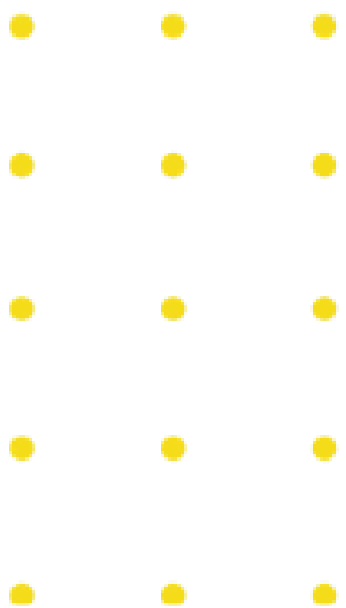

Digital Forensics &

Incident Response

DFIR

Topic 1: Incident Response

Incident Response Process

The incident response process includes identifying an attack, understanding its severity and prioritizing it, investigating and mitigating the attack, restoring operations, and taking action to ensure it won't recur.

Preparation

The Preparation phase involves preparing your organization to handle incidents.

This step involves outlining everyone's responsibilities, hardware, tools, documentation, etc.

- Rules and Policies
- Toolkit
- Threats and Techniques

This phase also involves taking steps to reduce the probability of an incident from ever occurring.

Preparation

Identification

- Also known as scoping
- Proper identification of ALL systems compromised
- Most skipped step

Where the IR team would confirm if a breach took place.

They would analyze all the symptoms which were reported, and confirm whether or not the situation would be classified as an incident.

Identification

Containment

- Includes Intelligence development
- Lateral movement?
- Kind of malware?

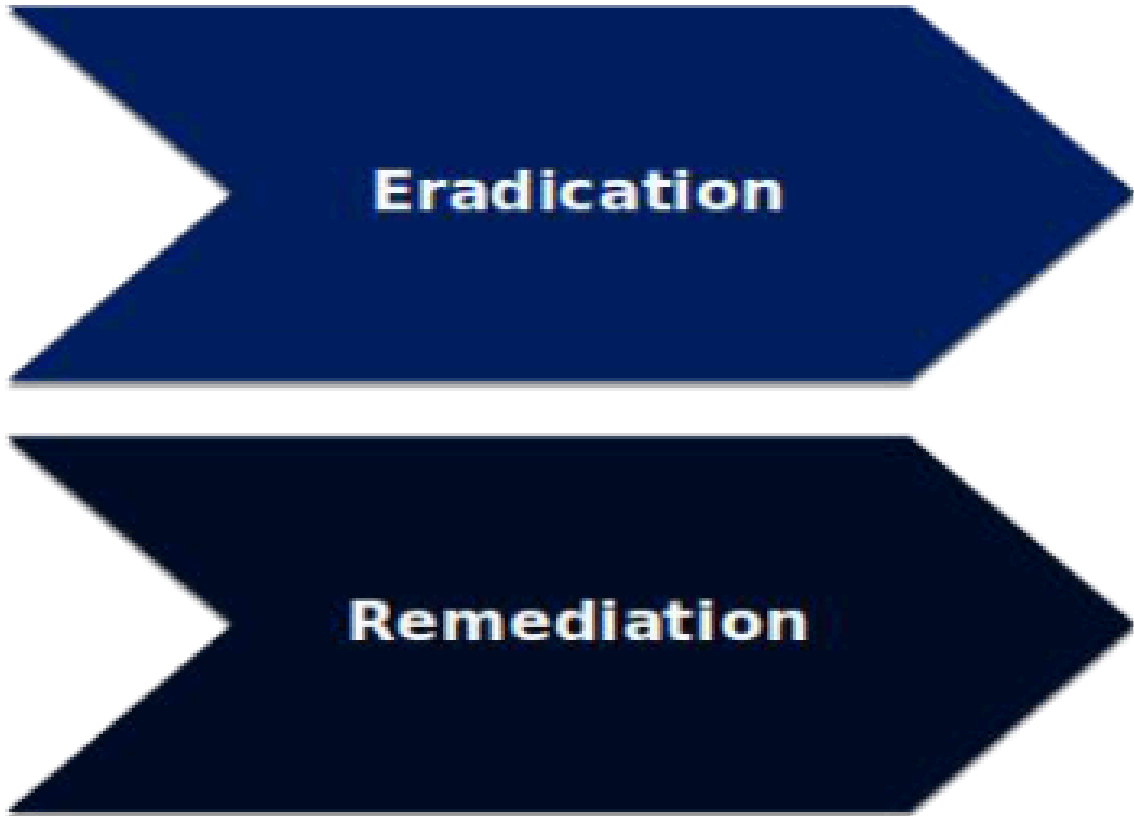

Containment

Eradication / Remediation

Required to be completed in a short amount time:

- Block malicious IP addresses
- Block malicious domain names
- Rebuild compromised systems
- Enterprise password change
- Verification of all remediation activities

Eradication

Remediation

Where the IR team would gather intel & create signatures that will aid them in identifying each compromised system. With this information, countermeasures can be put in place to neutralize the attacker and attempt to restore systems/data back to normal.

Lessons Learned

Also known as Follow up/ Threat

- Application of learning
- Additional counter measures are implemented
- Additional monitoring
- Network monitoring

A.K.A → Post incident activity

In this phase, the goal is to improve the overall security posture of the organization, and to assure that a similar incident won't happen again.

Lessons Learned
